

NORTH WEST BIO-ENERGY LTD ACHIEVES 100% PRODUCTION IN THREE WEEKS.

North West Bio-Energy started grinding wheat on August 23rd and hit 100% production on Sept. 13th. This is about 72,000 litres per day. One of the 375,000 litre Ethanol storage tanks has been filled and certified. Shipping will start from that tank this week. The second tank is now being filled.

The Distillers Grain dryer is up and running. The steam that you see rising from the plant is from the dryer. The dryer is using recycled heat from the boiler (that would normally go out the chimney) to dry the distillers grain. The quality of the distillers grain looks very good and it will be shipped off to cattle feeders. The plant will produce 71 tonnes of distillers grain per day.
